

# Can you spot the difference? You won't...but your machine will!

## Did you know...

- Maximum Starter power may be reduced by approx 15%\*\* using a battery at only 70% of charge. This may result in a reduced Starter life span.
- A dead or poorly charged battery may lead to an overload in the Alternator with unnecessary surcharges or undue stress.
- If the power output of the Alternator drops, it will eventually cause the Battery to die and ignition system to fail.

\* Battery approved by AGCO Engineering Centre

\*\* Test set at -20°C
